

What exactly is the AI Question that no AI Person Asks?

Hank asks whether Ai can be applied to solve a real tangible problem. That which is housing.

Does Green think AI will solve the world's problems? Why or why not?

He does not think AI will solve the world's problems on its own. He believes it may increase the amount of intelligence available to the world but he debates that wisdom is the real driver in making changes to our world.

Assemble the best argument you can for this and document it step-by-step. Order the evidence or reasons as consistently as possible.

Premise 1: AI is a powerful tool that can make many tasks faster and easier, but it does not solve problems simply by being intelligent.

Premise 2: The world's biggest problems, such as housing and access to healthcare, are mainly caused by social, political and institutional barriers rather than a lack of intelligence or information.

Premise 3: Even if AI discovers better solutions or creates new technologies, those solutions still require people, governments and institutions to implement them fairly and effectively.

Premise 4: Since AI cannot change power structures or guarantee that resources reach the people who need them, it cannot solve these problems on its own.

Conclusion: Therefore, even if AI is a powerful technology capable of transforming our society, it will not inherently solve the world's biggest problems simply because it provides a source of intelligence. These problems depend more on human and societal institutions, incentives, and our wisdom more than intelligence alone.
